

WHERE SHOULD YOUR DATA LIVE?

Opening new markets, choosing data centers, selecting vendors. Every data decision carries massive risk. In 2024 alone, GDPR fines reached €1.2 billion, yet companies still rely on \$25K-\$75K manual assessments that take weeks and cover fewer than 70 countries. We introduce the **Data Protection Index**: AI-powered system for automated and scalable assessment countries data protection efforts.

The Problem

Companies face €4.4M average GDPR fines but have no way to assess which countries ACTUALLY protect data.

- Since Privacy International stopped in 2007: 17-year gap
- Manual assessment: \$50K+ per country, takes weeks
- Existing rankings: <70 countries, measure laws not enforcement

The Solution

Automated, enforcement-based country rankings

- Dual Score: Legal Framework + Enforcement Reality
- 10 minutes vs. weeks | \$0.50 vs. \$50K
- 100+ countries covered
- Measures what countries DO, over what laws PROMISE

Applications

- Tech companies → Data center location decisions
- Investors → M&A due diligence & risk assessment
- Law firms → Cross-border data transfer advisory
- Compliance teams → Vendor risk evaluation
- Governments → Performance benchmarking

Why it matters

€4.4M average fine → Avoid with better decisions
\$50K → \$0.50 → 10,000× cost reduction
20-40% compliance savings → Choose right jurisdictions
